

# Package ‘nonsmooth’

July 3, 2024

**Title** Nonparametric Methods for Smoothing Nonsmooth Data

**Version** 1.0.0

**Imports** stats, np, graphics, reshape2

**Maintainer** John R.J. Thompson <john.thompson@ubc.ca>

**Description** Nonparametric methods for smoothing regression function data with change-points, utilizing range kernels for iterative and anisotropic smoothing methods. For further details, see the paper by John R.J. Thompson (2024) <[doi:10.1080/02664763.2024.2352759](https://doi.org/10.1080/02664763.2024.2352759)>.

**License** CC BY 4.0

**URL** <https://github.com/jrjthompson/R-package-nonsmooth/>

**BugReports** <https://github.com/jrjthompson/R-package-nonsmooth/issues>

**Depends** R (>= 3.5.0)

**Repository** CRAN

**LazyData** true

**LazyDataCompression** xz

**NeedsCompilation** no

*Iterative anisotropic local constant smoothing*

---

### Description

This function implements the method in Thompson, J.R.J. (2024) for iterative smoothing of change-point data that utilizes oversmoothed estimates of the underlying data generating process to inform re-smoothing. The function calculates a local constant estimator  $\tilde{g}(X)$  of  $Y = g(X) + \epsilon$ , and then utilizes  $\tilde{g}(x)$  in the range kernel of another local constant estimator. This process is iterated for a specified number of resmooth iterations.

### Usage

```
alc(X, Y, bw.fixed.value=NULL, resmooths=1, ...)
```

### Arguments

X	numeric matrix of $p$ columns of the observations for continuous explanatory variables.
Y	numeric vector of the continuous response variable.
bw.fixed.value	numeric value for the bandwidth of the range kernel. Setting this value sets the iterative smoothing bandwidths to be the local constant estimator bandwidths for domain kernels and the set value for the range kernel. Default is NULL, which is an optimal bandwidth selection procedure during each re-smooth through the <code>npreg</code> function.
resmooths	integer number of resmooth iterations. Default is 1 resmooth, which is a suggested starting point for iterative smoothing.
...	additional specifications for <code>np</code> smoothing, such as optimal bandwidth selection procedure, kernel type, regression estimator, and so on. See <code>npreg</code> function for more details and defaults.

### Value

The code here returns a `npregression` object of the iteratively smoothed estimator. For more details, see the `npreg` function in the `np` package.

**Examples**

```

library(np)
options(np.messages=FALSE)

## 1D Simulated change-point data
changepoint.data <- changepoint.sim1D(500)

## Isotropic local constant model
bw.lc <- npregbw(Y~X,data=changepoint.data)
model.lc <- npreg(bw.lc)

## Anisotropic local constant model with one resmooth iteration
model.alc <- alc(changepoint.data$X,changepoint.data$Y)

## Plot isotropic and anisotropic smoothers
plot(changepoint.data$X,changepoint.data$Y,xlab = "X",ylab = "Y",
      pch=1,col="grey",las=1)
lines(changepoint.data$X,model.lc$mean,col="blue",lty=1)
lines(changepoint.data$X,model.alc$mean,col="red",lty=1)

## 2D Simulated image change-point data
## This simulation and estimation can take up to 5 minutes
library(reshape2)
changepoint.data <- changepoint.sim2D(data.dim=c(50,50))
image(changepoint.data)

## Melt the 2D image data for model estimation
changepoint.data.melt <- melt(id.var=1:nrow(changepoint.data), changepoint.data)

## Isotropic local constant model
bw.lc <- npregbw(xdat=changepoint.data.melt[,1:2],ydat=changepoint.data.melt[,3])
model.lc <- npreg(bw.lc)

image(1:dim(changepoint.data)[1], 1:dim(changepoint.data)[2],
      matrix(model.lc$mean, nrow=dim(changepoint.data)[1], byrow=FALSE))

## Anisotropic local constant model with one resmooth iteration and
## and fixed range kernel bandwidth
model.alc <- alc(changepoint.data.melt[,1:2],changepoint.data.melt[,3],bw.fixed.value=10)

image(1:dim(changepoint.data)[1], 1:dim(changepoint.data)[2],
      matrix(model.alc$mean, nrow=dim(changepoint.data)[1], byrow=FALSE))

## 2D real fire spread change-point data
data("fireData")
changepoint.data <- fireData[,1,20]

## Plot with pixel locations
image(1:dim(changepoint.data)[1], 1:dim(changepoint.data)[2],
      matrix(changepoint.data, nrow=dim(changepoint.data)[1], byrow=FALSE))

## Melt the 2D image data for model estimation

```

```

changepoint.data.melt <- melt(id.var=1:nrow(changepoint.data), changepoint.data)

## Isotropic local constant model
bw.lc <- npregbw(xdat=changepoint.data.melt[,1:2],ydat=changepoint.data.melt[,3])
model.lc <- npreg(bw.lc)

image(1:dim(changepoint.data)[1], 1:dim(changepoint.data)[2],
      matrix(model.lc$mean, nrow=dim(changepoint.data)[1], byrow=FALSE))

## Anisotropic local constant model with one resmooth iteration and
## and fixed range kernel bandwidth
model.alc <- alc(changepoint.data.melt[,1:2],changepoint.data.melt[,3],bw.fixed.value=10)

image(1:dim(changepoint.data)[1], 1:dim(changepoint.data)[2],
      matrix(model.alc$mean, nrow=dim(changepoint.data)[1], byrow=FALSE))

options(np.messages=TRUE)

```

---

changepoint.sim1D      *Simulated change-point data for one-dimension*

---

## Description

This function simulates one-dimension change-point data for three data types, and one smooth data type for testing change-point regression estimators.

## Usage

```
changepoint.sim1D(n,sigma=1,data.type = "continuousWithJump")
```

## Arguments

n	Integer value for sample size.
sigma	Numeric value of standard deviation.
data.type	Character value for different data types. The options for change-point data are: constant functions separated by two jumps ("uniformJump"), linear functions separated by two change-points in the first derivative ("gradualJump"), and nonlinear data with a jump ("continuousWithJump"). A smooth continuous function with no change-points ("continuous") is the same functions as "continuousWithJump" but without the change-point. See Thompson, J.R.J. (2024) for more details on these data types.

## Value

This function produces a data.frame, consisting of the simulated data and the data generating process.

X	Numeric vector of explanatory data
Y	Numeric vector of response data
oracle	Numeric vector of the data generating process for Y

## References

Thompson, J.R.J. (2024) “Iterative Smoothing for Change-point Regression Function Estimation”, *Journal of Applied Statistics*, 1-25. <doi:10.1080/02664763.2024.2352759>

## Examples

```
## 1D continuous data of nonlinear functions with a jump change-point
changepoint.data <- changepoint.sim1D(100)
plot(changepoint.data$X,changepoint.data$Y,xlab = "X",ylab = "Y",pch=1,col="grey",las=1)
lines(changepoint.data$X,changepoint.data$oracle,col="red",lty=1)

## 1D continuous data of constant functions with two jump change-points
changepoint.data <- changepoint.sim1D(100,data.type="uniformJump")
plot(changepoint.data$X,changepoint.data$Y,xlab = "X",ylab = "Y",pch=1,col="grey",las=1)
lines(changepoint.data$X,changepoint.data$oracle,col="red",lty=1)

## 1D continuous data of linear functions with two derivative change-points
changepoint.data <- changepoint.sim1D(100,data.type="gradualJump")
plot(changepoint.data$X,changepoint.data$Y,xlab = "X",ylab = "Y",pch=1,col="grey",las=1)
lines(changepoint.data$X,changepoint.data$oracle,col="red",lty=1)

## 1D continuous data of a nonlinear continuous function
changepoint.data <- changepoint.sim1D(100,data.type="continuous")
plot(changepoint.data$X,changepoint.data$Y,xlab = "X",ylab = "Y",pch=1,col="grey",las=1)
lines(changepoint.data$X,changepoint.data$oracle,col="red",lty=1)
```

---

changepoint.sim2D      *Simulated change-point data for two-dimensions*

---

## Description

This function simulates circular change-point data with Gaussian noise.

## Usage

```
changepoint.sim2D(data.dim = c(100,100),sigma = 20,radius=NULL,cbase=80,ctop=130)
```

## Arguments

data.dim	Vector of two integers for the size of the two-dimensional dataset. The dimensions are suggested to be the same. However, for uneven dimensions, the first value must be larger. The default is an image of 100 by 100 pixels.
sigma	Numeric value of standard deviation.
radius	Numeric value of the radius of the inner disk before the change-point. The radius cannot be larger than one-half of either dimension in data.dim. Defaults to one-quarter of the first dimension of data.dim.
cbase	Numeric value for the disk that radiates out from the approximate center of the dataset.

ctop                    Numeric value after the circular change-point, separating the disk and the outer region.

### Value

This function produces a matrix of integer values of the same dimensions as `data.dim`.

### References

Thompson, J.R.J. (2024) “Iterative Smoothing for Change-point Regression Function Estimation”, *Journal of Applied Statistics*, 1-25. <doi:10.1080/02664763.2024.2352759>

### Examples

```
## Simulate 2D data and plot it
library(reshape2)
changepoint.data <- changepoint.sim2D()
image(1:nrow(changepoint.data), 1:ncol(changepoint.data),
      matrix(changepoint.data, nrow=nrow(changepoint.data), byrow=FALSE))
```

---

fireData

*Wax paper fire smouldering experiment conducted in a fume hood*

---

### Description

The fire spread data consists of 45 segmented RGB images from a fire smouldering experiment of wax paper. The data were measured using a digital camera at a birds-eye view above the experiment. The data is segmented 1 frame per second.

### Usage

```
data("fireData")
```

### Format

The movie of the fire spread is a data frame with four dimensions. The first and second dimensions of the data frame are the pixel coordinates of one image. The third dimension is the RGB channel, with the red channel (1), blue channel (2), and green channel (3). The fourth dimension is time, starting at ignition (time point 1), and then each RGB image is separated by one second for a total of 45 seconds.

## Example - viewing a fire spread experiment that contains change-points

data("fireData")

## Plot the red channel at 10 seconds as a 2d image

image(1:dim(fireData)[1], 1:dim(fireData)[2],
      matrix(fireData[, , 10], nrow=dim(fireData)[1], byrow=FALSE))
```

---

nonsmooth

*Nonparametric methods for smoothing nonsmooth data*

---

## Description

This package provides nonparametric methods for smoothing nonsmooth data. Change-point data is the intended application, with a focus on those with jumps in the regression function. Descriptions of the implementation of these methods can be found in Thompson, J.R.J. (2024).

## Details

This package contains two additional functions for simulated one-D and two-D change-point data. This package also contains a real fire spread dataset from a micro-fire experiment. This data can be viewed as time dependent two-dimensional change-point data. The boundaries between fuel, burning and burn-out regions are separated by two change-point curves. More information on experimentation and data can be found in Thompson, Wang, and Braun (2020) and Wang, Thompson, and Braun (2019).
